## **Acknowledgement**

We're delighted to present this report, marking the culmination of our Diploma in Computer Engineering journey. It reflects our dedication and hard work. Our heartfelt thanks go to all supported us during this project. We're especially grateful to Prof. Mittal Joiser for his invaluable guidance, as well as our faculty members who played a vital role in our academic journey. We also extend our appreciation to our project guide and fellow faculty members for their consistent guidance and motivation. Your contributions were pivotal. To everyone who shaped our project and enriched our understanding, we're thankful for your unwavering support. Your wisdom, guidance and encouragement were instrumental in our success.

## **Abstract**

The Celestial Watches e-commerce platform is designed to revolutionize the online shopping experience for luxury watches. This project aims to create a user-friendly interface that facilitates seamless interactions between buyers and sellers, ensuring a secure and efficient transaction process. The platform will offer features such as user registration, product browsing, shopping cart management, and order processing, all while maintaining high standards of security and data protection. By integrating advanced functionalities like personalized recommendations, customer support, and a robust feedback system, Celestial Watches seeks to enhance user engagement and satisfaction. The system will operate on a scalable architecture, capable of handling a significant number of concurrent users and transactions, thereby ensuring reliability and performance. This project not only addresses the growing demand for luxury watches in the digital marketplace but also emphasizes the importance of user experience and security in e-commerce. Through this initiative, Celestial Watches aims to establish itself as a trusted platform for luxury watch enthusiasts, providing them with a comprehensive and enjoyable shopping experience.

The Celestial Watches e-commerce platform offers a comprehensive suite of functionalities designed to enhance the user experience and streamline operations. Users can register and log in securely, browse a wide range of luxury watches, and utilize advanced search and filtering options to find products that meet their preferences. Each product features a detailed page with specifications and customer reviews, while the shopping cart allows for easy management of selected items. The secure checkout process integrates various payment methods, enabling users to finalize their purchases efficiently. Additionally, the platform supports order management, wishlist functionality, and personalized product recommendations. Customer support tools, including FAQs and live chat, ensure users receive assistance when needed. For administrators, a robust dashboard facilitates inventory management, order tracking, and promotional campaign management, all while maintaining high security standards through SSL encryption and two-factor authentication.

**Figure. 1.1** Admin Activity

The Admin Activity Diagram (Figure. 1.1) illustrates the sequence of tasks and processes performed by administrators on the Celestial Watches platform.

**Figure. 1.2** Admin Flowchart

The Admin Flowchart (Figure. 1.2) demonstrates the decision-making process and the flow of tasks that administrators follow to manage operations on the Celestial Watches platform.

**Figure. 2.1** ER Diagram

The Entity-Relationship Diagram (Figure. 2.1) depicts the database schema and the relationships between various entities within the Celestial Watches system.

**Figure. 3.1** Class Diagram

The Class Diagram (Figure. 3.1) illustrates the structure of the Celestial Watches system, including the classes, their attributes, methods, and relationships.

**Figure. 4.1** Sequence Diagram

The Sequence Diagram (Figure. 4.1) shows the interactions between different system components over time during key operations on the Celestial Watches platform.

**Figure. 5.1** User Activity Diagram

The User Activity Diagram (Figure. 5.1) outlines the various user actions and their interactions with the system on the Celestial Watches platform.

**Figure. 5.2** User Flowchart Diagram

The User Flowchart (Figure. 5.2) illustrates the step-by-step flow of user interactions and decision-making processes on the Celestial Watches platform.

**Figure. 6.1** DFD Level 0 Diagram

The DFD Level 0 (Figure. 6.1) provides an overview of the Celestial Watches system, showing the major processes and data flows between the system and external entities.

**Figure. 6.2** DFD Level 1 User Diagram

The DFD Level 1 for User (Figure. 6.2) breaks down the interactions and processes specifically related to user actions within the Celestial Watches platform.

**Figure. 6.3** DFD Level 1 Admin Diagram

The DFD Level 1 for Admin (Figure. 6.3) outlines the processes and data flow involved in admin-related activities within the Celestial Watches system.

**Figure. 6.4** DFD Level 2 User Diagram

The DFD Level 2 for User (Figure. 6.4) details the internal processes and data exchanges specific to user activities within the Celestial Watches platform.

**Figure. 6.5** DFD Level 2 Admin Diagram

The DFD Level 2 for Admin (Figure. 6.5) elaborates on the admin's internal processes and interactions within the Celestial Watches system

# **1. Introduction**

In recent years, the luxury watch market has experienced a significant transformation, with an increasing number of consumers turning to online platforms for their shopping needs. This shift highlights the necessity for e-commerce solutions that not only provide a wide selection of high-end timepieces but also prioritize user experience and security. Celestial Watches aims to fill this gap by creating a sophisticated e-commerce platform tailored specifically for luxury watch enthusiasts. By combining advanced functionalities with a user-friendly interface, the platform seeks to facilitate seamless interactions between buyers and sellers. This initiative not only addresses the growing demand for luxury watches in the digital landscape but also sets a new standard for security and engagement in online shopping. Through this project, Celestial Watches aspires to establish itself as a trusted destination for those seeking both quality and convenience in their luxury watch purchases.

## **1.1 Document Purpose**

The product described in this Software Requirements Specification (SRS) is the Celestial Watches(CW) website. This document outlines the software requirements for the CW website, detailing the functionalities, performance criteria, and design constraints. The scope of this SRS encompasses the entire system, including all major subsystems and components, ensuring a comprehensive understanding of the software's capabilities and limitations.

This SRS serves as a foundational document for developers, testers, and stakeholders, providing a clear and detailed description of the software's intended behavior and interactions. It aims to facilitate a common understanding among all parties involved, ensuring that the final product meets the specified requirements and user expectations.

## **1.2 Product Scope**

Aim is to accumulate an audience of Watch enthusiast, collectors, upper middle class or wealthy class people. The website is branded around luxury watches which can be an indication of value and prestige or can also be bought as an investment for future and also a good pick for watch enthusiast who likes to collect such master pieces. Some benefit to acquire products from our website comes with professional benefit such as our scheme to provide the user with accustomed NFTs as a form on investment with the CW Watches. NFTs can only be acquired by the users who have availed the membership.

### 1.3 Intended Audience and Document Overview

This document is intended for a diverse audience, including developers, project managers, marketing staff, users, testers, and documentation writers. Specifically, it is tailored for the client and the professor overseeing the project. Each reader type will find relevant information to understand the scope, requirements, and functionalities of the CW Website. The rest of this SRS is organized into several key sections:

1. Introduction: Provides an overview of the CW Website, including its purpose, scope, and intended audience.
2. Overall Description: Describes the general factors that affect the product and its requirements.
3. Specific Requirements: Details the functional and non-functional requirements of the CW Website.
4. System Features: Outlines the major features of the CW Website.
5. Other Non-functional Requirements: Covers performance, security, and other quality attributes.

### 1.4 Definitions, and Abbreviations

*Table 1.4.1: Definition and Abbreviation Table*

| Abbreviations | Definitions                       |
|---------------|-----------------------------------|
| API           | Application Programming Interface |
| CRUD          | Create, Read, Update, Delete      |
| CSS           | Cascading Style Sheet             |
| DB            | Database                          |
| HTML          | Hypertext Markup Language         |
| HTTP          | Hypertext Transfer Protocol       |

|        |                                              |
|--------|----------------------------------------------|
| MYSQL  | My Structured Query Language                 |
| NFT    | Non Fungible Token                           |
| PCIDSS | Payment Card Industry Data Security Standard |
| PHP    | Hypertext Preprocessor                       |
| SEO    | Search Engine Optimization                   |
| SMTP   | Simple Mail Transfer Protocol                |
| SSL    | Secure Socket Layer                          |
| UI     | User Interface                               |

## 1.5 Document Conventions

In general, this document adheres to the IEEE formatting requirements. The font used throughout the document is Arial, in size 11 or 12, which ensures readability and consistency. Comments within the document are presented in italics to distinguish them from the main content, providing clarity on additional notes or explanations. The text is single-spaced, maintaining a clean and organized appearance, while 1-inch margins are kept on all sides to ensure proper formatting and presentation. Section and Subsection titles follow the template guidelines, ensuring a clear hierarchy and structure within the document. Additionally, sections and subsections are numbered sequentially to facilitate easy navigation and reference. When presenting multiple items or steps, bullet points or numbered lists are utilized for clarity, enhancing readability. All tables and figures included in the document are labeled and referenced appropriately within the text, accompanied by captions that describe their content. Important terms or concepts may be highlighted using bold or underlined text to draw attention. Consistency in terminology, formatting, and style is maintained throughout the document to uphold professionalism. Furthermore, it is essential to describe any additional standards or typographical conventions that were followed while writing this Software Requirements Specification (SRS), including specific fonts or highlighting that carry special significance. Dividing this section into several subsections, such as Formatting Conventions and Naming Conventions, may also enhance clarity and readability.

## **2. Overall Description**

### **2.1 Product Perspective**

This is a product created around luxury watch brands to work as a medium between with the user and the brand itself to provide a smooth and well accustomed way to make a purchase of the product via website with the comfort of their own home.

Website also provides additional features to the user to not just buy a product but to sell their own timepiece on our website for other users to acquire or if the user wish to not sell but auction, we also provide the user with an auction house system where they can submit their timepiece for a time based auction. Also to provide user with an investment criteria, website also avails a membership program with allows a better experience for the user who is vastly active on the website and such user can acquire NFTs associated within the website, providing a beneficial plan for a long-term user.

### **2.2 Product Functionality**

The CW Website must perform or allow users to perform the following major functions: The system includes several key features to support effective project and team management. For user management, it offers registration and authentication, role-based access control, and profile management.

In project management, users can create, edit, and delete projects, assign tasks to team members, and set timelines and milestones for each project. Task management functionalities allow the creation, editing, and deletion of tasks, assignment of tasks to specific users, and tracking of task progress and status. Communication is facilitated through real-time messaging between team members, email notifications for task updates and deadlines, and discussion forums for project-related topics.

The reporting and analytics module enables the generation of project status reports, visualization of project progress through charts and graphs, and the ability to export data for external analysis. Additionally, the system supports integration with external calendar applications, email servers for notifications, and provides API access for third-party tool integration.

### **2.3 Users and Characteristics**

Customers are the end users who will frequently interact with the product to browse, compare, and purchase items. They may vary in technical expertise, from novice users who require straight forward navigation assistance to more experienced users who are comfortable with advanced features such as product comparisons and special offers. Customers typically have varying educational backgrounds, but

they generally possess a basic understanding of online shopping processes. Their frequency of use is high, as they will engage with the product regularly to explore new products, manage their accounts, and take advantage of promotions. Satisfying this group is crucial, as their overall experience directly impacts the product's success.

Sellers are users who list their products on the platform. They may have moderate to high technical expertise, as they need to navigate the product listing process, manage inventory, and respond to customer inquiries. Sellers often have a background in retail or e-commerce and may vary in their experience level with online selling. Their engagement with the product is less frequent than that of customers, as they primarily interact with the platform when managing their listings or responding to offers. While important, their needs are secondary to those of the customers, as the primary goal is to ensure a seamless shopping experience.

Administrators are responsible for overseeing the platform's operations, including user management, product listings, and system maintenance. They possess high technical expertise and are typically well-educated, often holding degrees in fields related to information technology or business management. Administrators engage with the product on a daily basis to ensure its functionality and address any issues that arise. Their role is critical

*to the product's success, as they maintain the system's integrity and its essential for maintaining proper structure of website and make it workable.*

## **2.4 Operating Environment**

Main operating environment for the product will be web browser based. i.e. Google chrome, Mozilla firefox, Microsoft edge, etc. It may as well be accessible via a laptop/desktop PC or a mobile phone or such devices with internet and web browser access and compatibility.

## **2.5 Design and Implementation Constraints**

The CW Website development must adhere to several critical constraints to ensure optimal performance and integration with other systems. In terms of hardware limitations, the system must operate efficiently within the memory constraints of standard web servers, ensuring that it performs well without excessive resource consumption. Real-time communication features need to have minimal latency to guarantee seamless user interactions. Regarding external integrations, the website must integrate with email servers

and calendar applications, requiring robust and secure API interfaces to ensure compatibility and data integrity. The development process must utilize specific technologies, including React for the frontend, Node.js for the backend, and MongoDB for the database, as specified by the client. Additionally, developers are required to use tools like Git for version control and Jenkins for continuous integration and deployment. From a security standpoint, the system must comply with data protection regulations, such as GDPR, to securely store and process user data. It must also implement robust authentication and authorization measures, including multi-factor authentication and role-based access control to protect sensitive information. Developers must adhere to the client's coding standards and best practices to ensure maintainability and consistency, and comprehensive documentation must be provided for all code and system components to facilitate future updates and maintenance. These constraints are essential to ensure the CW Website meets all specified requirements and functions effectively within the defined parameters.

## **2.6 User Documentation**

The CW Website will be supported by comprehensive user documentation to ensure that all users can effectively utilize the software. The documentation will include several key components: User Manuals, which will provide detailed guides covering all functionalities of the website and be tailored for different user roles, such as project managers, team members, and administrators; Online Help, offering context-sensitive assistance integrated within the website to provide immediate explanations for various features and tasks; and an FAQ section addressing common issues and offering solutions to typical problems users may encounter. The user documentation will be available in both digital (PDF) and web-based formats, ensuring accessibility and ease of use. All documentation will adhere to industry standards for clarity, completeness, and usability, serving as a valuable resource for all users.

## **2.7 Assumptions and Dependencies**

The following assumptions and dependencies could significantly affect the requirements and design of the CW Website. The CW Website project is based on several assumptions and dependencies that will influence its development and performance. It is assumed that the website will support up to 500 concurrent users, which affects the system's scalability and performance requirements. The system will integrate with third-party services such as popular email servers (e.g., Gmail, Outlook) and calendar applications (e.g., Google Calendar, Microsoft Outlook Calendar), with the expectation that these services will remain stable and provide consistent APIs. The development team will have access to the latest versions of the required technologies, including React, Node.js, and MongoDB. Any changes in the

availability or versions of these technologies could impact the development process. The website will be hosted on cloud infrastructure (e.g., AWS, Azure) with sufficient resources to handle peak loads, and any limitations or changes in the cloud service provider's offerings could affect the system's performance and availability. It is assumed that the client's organization will provide the necessary resources and support to ensure compliance with data protection regulations such as GDPR; any changes in regulatory requirements or the client's ability to comply could impact the system's design and implementation. Additionally, the project will reuse certain software components from previous projects, such as authentication modules and user interface templates, with the assumption that these components are compatible and can be integrated without significant modifications. These assumptions and dependencies must be closely monitored throughout the project lifecycle to ensure that any changes are addressed promptly, minimizing their impact on the CW Website's development.

## **3. Specific Requirements**

### **3.1 External Interface Requirements**

#### **3.1.1 User Interfaces**

The following assumptions and dependencies could significantly affect the requirements and design of the CW Website. The CW Website project is based on several assumptions and dependencies that will influence its development and performance. It is assumed that the website will support up to 500 concurrent users, which affects the system's scalability and performance requirements. The system will integrate with third-party services such as popular email servers (e.g., Gmail, Outlook) and calendar applications (e.g., Google Calendar, Microsoft Outlook Calendar), with the expectation that these services will remain stable and provide consistent APIs. The development team will have access to the latest versions of the required technologies, including React, Node.js, and MongoDB. Any changes in the availability or versions of these technologies could impact the development process. The website will be hosted on cloud infrastructure (e.g., AWS, Azure) with sufficient resources to handle peak loads, and any limitations or changes in the cloud service provider's offerings could affect the system's performance and availability. It is assumed that the client's organization will provide the necessary resources and support to ensure compliance with data protection regulations such as GDPR; any changes in regulatory requirements or the client's ability to comply could impact the system's design and implementation. Additionally, the project will reuse certain software components from previous projects, such as authentication modules and user interface templates, with the assumption that these components are compatible and can be integrated without significant modifications. These assumptions and dependencies must be closely monitored throughout the project lifecycle to ensure that any changes are addressed promptly, minimizing their impact on the CW Website's development.

#### **3.1.2 Hardware Interfaces**

The CW Website will interact with a range of hardware components to support a seamless user experience. Server hardware will be managed via cloud servers (e.g., AWS, Azure) or dedicated physical servers, providing a foundation for HTTP requests, database operations, and backend processes. These servers require ample computational power, memory, and storage to guarantee optimal performance, and libraries such as Express.js for Node.js will be employed to manage server-side operations and hardware interactions. For database operations, the website will connect to cloud-based database services like MongoDB Atlas or dedicated database servers to perform essential CRUD (Create, Read, Update, Delete) actions. Database hardware must support high availability and scalability, with Mongoose for MongoDB

facilitating smooth communication between the website and database infrastructure. The CW Website will also support a user device interface, accessible across various devices, including desktops, laptops, tablets, and smartphones. These user devices must be compatible with modern web browsers (e.g., Chrome, Firefox, Safari) to display the interface and handle user interactions. React will be used on the frontend to create responsive, interactive user interfaces that adapt to different screen sizes and device types. Additionally, an external system interface will connect the CW Website with systems like email servers and calendar applications to manage notifications and calendar events, requiring stable and secure APIs. Libraries like Axios or Fetch API will support HTTP requests and interactions with these external systems. Together, these hardware interfaces allow the CW Website to communicate effectively with various hardware components, delivering a stable and reliable user experience.

### **3.1.3 Software Interfaces**

The CW Website will interface with the operating system to support backend and frontend operations efficiently. Compatible with both Windows and Linux, the site will likely use Linux for server deployments due to its stability and performance. On the backend, the Node.js server will manage HTTP requests, file I/O, and system resources through OS-level interactions, while the frontend, built with React, will run in browsers across different operating systems to render the UI, handle user inputs, and cache data locally. Essential services include a web server (e.g., Nginx or Apache) to manage incoming HTTP requests and secure network communication, as well as a MongoDB database server, which will interact with the OS for data storage and CRUD operations. Inter-Process Communication (IPC) may be used between the backend server and other processes, and network protocols (e.g., HTTP/HTTPS) will ensure secure connections with external systems and user devices. Shared data, including configuration files and log files, will be stored and managed by the OS

to facilitate system settings, environment variables, and event monitoring. Implementation constraints require proper file permissions and efficient resource allocation by the OS to maintain data integrity and prevent unauthorized access, ensuring a robust and stable user experience on the CW Website.

### **3.1.4 Communications Interfaces**

The CW Website will use several communication functions to enable secure and seamless interaction among users, external systems, and the backend server. Communication between users' web browsers and the server will rely on HTTP/HTTPS protocols, with HTTPS ensuring encrypted, tamper-proof data transmission. Standard web technologies like HTML, CSS, and JavaScript will be employed to create an interactive and accessible user interface. For email notifications and alerts, the system will integrate with

external email servers (e.g., Gmail, Outlook) using SMTP, with HTML-formatted emails for compatibility across clients. The backend server will communicate securely with the database and third-party APIs using MongoDB's native protocol over TLS/SSL for database transactions and RESTful APIs over HTTPS for external integrations, ensuring data integrity and confidentiality. Synchronization mechanisms, such as WebSockets, will support real-time updates and notifications to keep the interface synchronized with backend changes, enhancing responsiveness. Encryption protocols like TLS/SSL will protect all data exchanged among users, the server, and external systems, safeguarding sensitive information and providing a secure, consistent, and user-friendly experience.

### **3.2 Functional Requirements**

The functional requirements of the CW Website are organized into key operational areas to ensure comprehensive support for user needs across various functions.

User Management covers several essential user interactions. For user registration, the website will allow users to create accounts by entering details like their name, email, and password. The system will validate the provided information and send a confirmation email for account verification. During authentication, users will log in using their email and password, with optional multi-factor authentication to enhance security. Role-based access control will assign specific roles, such as Admin, Project Manager, or Team Member, to users, enabling tailored access based on responsibilities. Additionally, users will be able to view and edit their profiles, change passwords, and set up notification preferences for effective profile management. Project Management encompasses functions for handling project creation, editing, deletion, and assignments. Authorized users can create new projects by providing details like name, description, and deadlines, with each project receiving a unique identifier. Project editing capabilities will allow users to modify details and track changes with a history log. Project deletion will include a confirmation prompt and ensure that all related tasks and data are removed. The assignment feature will enable users to add team members to projects, with automatic notifications to inform assigned members of their involvement.

Task Management provides robust task-handling capabilities within projects. Users will be able to create tasks with specific details such as name, description, assignee, and due date, with each task uniquely identified. Task editing functionality will allow users to update these details while maintaining a history of changes. When tasks are deleted, the system will confirm the action and remove all associated data. Task assignment will allow users to assign specific team members to tasks, with notifications sent to inform assignees. Additionally, task progress tracking will enable users to update task statuses (e.g., Not

Started, In Progress, Completed) and provide visual indicators of progress.

Communication features include real-time messaging, email notifications, and discussion forums. Users will be able to send and receive real-time messages within the system, supporting both group and direct messaging. Email notifications will be sent for significant events like task assignments, project updates, and deadlines, with configurable user preferences. Discussion forums will allow users to create and join conversations about specific projects or topics, supporting threaded discussions for organized replies.

Reporting and Analytics offers tools for generating project status reports, visual analytics, and data export options. Users will be able to generate detailed reports on project statuses, including task completion rates, team performance, and milestones, with filters for custom report content. Visual analytics will display project data through charts and graphs, helping users analyze trends and performance. Data export features will enable users to export report data in formats like PDF and Excel, ensuring accuracy and completeness for external analysis.

Integration supports calendar and email integration along with API access. Calendar integration will allow the system to sync project deadlines and events with external calendars like Google Calendar or Microsoft Outlook, with customizable settings. Email integration will link the system with external email servers for sending notifications and alerts, also with configurable settings. Additionally, API access will enable third-party integrations, supporting operations such as creating, updating, and retrieving project and task data. These requirements collectively ensure that the CW Website will offer extensive project management and collaboration functionalities, fully addressing the needs of users.

### **3.3 Behaviour Requirements**

#### **3.3.1 Use Case View**

A use case for the celestial watches website would describe the various interactions a user might have with the site. For example, a use case could detail how a customer browses for high-end celestial watches, applies filters (like brand or price range), views product details, customizes watch models in real-time, and completes a purchase. Other use cases might involve the user logging into their account, saving favorites, or contacting customer support for product inquiries.

Each use case defines a specific goal a user wants to accomplish and describes the steps required to achieve it on the website. The purpose is to understand and document what users expect from the system, which

helps in designing user-friendly features.

A use case diagram is a visual representation that shows the relationship between different actors (users or other systems) and the actions (use cases) they perform within a system. For the celestial watches website, the actors could include a "Customer," "Admin," and possibly "Guest." Each actor would be connected to the use cases relevant to them, such as "Browse

Products," "Apply Filters," "View Product Details," "Customize Watch," and "Checkout."

The diagram typically uses simple shapes: ovals for use cases, stick figures for actors, and lines to connect actors with the use cases they participate in. This diagram provides a high-level view of the website's functionality and helps developers and stakeholders understand how users will interact with it.

Figure: 3.3.1 Use case diagram

## **4. Other Non-functional Requirements**

### **4.1 Performance Requirements**

The CW Website must meet specific performance requirements to deliver a responsive, reliable, and efficient user experience. For response time, the system must authenticate users and load the dashboard within 3 seconds after login, while task and project operations, including creation, editing, and deletion, should complete within 2 seconds. In terms of real-time communication, messaging must be delivered with a latency of no more than 1 second to facilitate smooth team interactions, and notifications, such as emails for task assignments and project updates, should be sent within 5 seconds of the triggering event. For data retrieval and display, the main dashboard—containing project summaries and recent activities—must load in under 3 seconds to provide immediate access to critical information. Report generation for project status reports should not exceed 5 seconds, even when handling extensive data from large projects.

To ensure scalability, the system is designed to support up to 500 concurrent users without compromising response times for essential functions like login and task updates, and it should handle large data volumes, including thousands of tasks and projects, through optimized database queries for swift data retrieval. For system availability, the CW Website must maintain a 99.9% uptime, with any scheduled maintenance announced in advance and kept brief. These performance requirements are fundamental to providing a fast, stable, and reliable experience that aligns with the needs of users and stakeholders.

### **4.2 Safety and Security Requirements**

The CW Website must meet stringent safety requirements to ensure data protection and reliability. To guard against data loss, the system will perform regular data backups and include a robust data recovery mechanism, capable of restoring data from backups within 1 hour of any data loss incident. Comprehensive error handling and logging must be in place to manage unexpected issues without system crashes or data loss. All significant events and errors will be logged in detail, supporting troubleshooting and maintaining system integrity. The system will also implement user activity monitoring to detect unauthorized actions, generating alerts for suspicious behavior like multiple failed login attempts or unauthorized access to sensitive data. The security requirements for the CW Website emphasize high-level data protection and safe operation. User identity authentication will be reinforced with multi-factor authentication (MFA) during login, and passwords will be securely stored using strong hashing algorithms like bcrypt. Data encryption is required for all data transmitted between users and the server using TLS/SSL, with additional encryption for sensitive data stored in the database to protect against

unauthorized access. Access control will use role-based access control (RBAC) to restrict data and functionalities based on user roles, ensuring that only users with the proper privileges can perform administrative actions like creating or deleting projects.

Compliance with data protection regulations, including GDPR, is mandatory to safeguard user privacy and data security, with regular security audits conducted to identify and address vulnerabilities. Lastly, the system must meet industry-standard security certifications such as ISO/IEC 27001, with regular penetration testing to mitigate security risks. Together, these safety and security measures establish a secure and reliable environment for users, ensuring data protection and system integrity.

### **4.3 Software Quality Attributes**

The CW Website must meet essential reliability requirements, including a 99.9% uptime achieved through redundant servers, regular maintenance, and continuous monitoring. Robust error handling will manage unexpected issues gracefully, with logged errors, user-friendly messages, and data recovery mechanisms. Maintainability will be ensured by designing a modular architecture through microservices and well-defined APIs, allowing component updates without affecting the entire system. Comprehensive code documentation will aid maintenance, including inline comments and detailed function descriptions. Additionally, automated testing with unit, integration, and end-to-end tests will prevent the introduction of new bugs.

For usability, the CW Website will feature an intuitive and user-friendly interface, adhering to user-centered design principles and established UI/UX standards, with usability testing to ensure accessibility. Compliance with WCAG 2.1 guidelines will make the system accessible to users with disabilities, providing keyboard navigation, screen reader support, and appropriate color contrast. Users will have access to training materials, including tutorials and online help, to maximize effective usage. The system's interoperability will be supported by well-documented APIs to integrate third-party tools and services, including RESTful APIs and webhooks for real-time notifications. Standard data formats like JSON and XML will ensure compatibility for data import and export. To enhance portability, the CW Website will ensure cross-platform compatibility with major browsers (e.g., Chrome, Firefox, Safari) and operating systems (Windows, macOS, Linux), achieved through responsive design and cross-browser testing. The system will also be deployable on various cloud platforms (AWS, Azure) and on-premises servers, facilitated by containerization technologies such as Docker.

Security will be prioritized through encrypted data transmission using TLS/SSL and role-based access control (RBAC) to limit access based on user roles. Compliance with data protection regulations such as GDPR will ensure privacy and security for user data. The system will also support adaptability through a scalable architecture that accommodates increased loads by adding servers, using load balancers, and implementing distributed computing techniques. Configurable settings will allow for customizable workflows, notification preferences, and user roles, addressing diverse organizational needs.

For testability, the CW Website will include an automated testing framework supporting continuous integration and deployment, along with unit, integration, and end-to-end tests. Achieving at least 80% test coverage of critical components will ensure that the majority of the codebase is tested and verified. Together, these quality characteristics make the CW Website reliable, maintainable, usable, interoperable, portable, secure, adaptable, and testable, fulfilling both customer and developer expectations.

## **5. Other Requirements**

### **5.1 Unique Features**

The CW Website's Personal Dashboard will offer comprehensive features to enhance user experience and engagement. Users will have access to User Profile and Settings, where they can view personal information such as name, email, and membership status, manage account settings including profile management, security (password changes and 2FA), payment methods, and membership/subscription details, with options to upgrade or view membership benefits. The Watch Collection feature will display owned watches with brand, model, purchase date, and status details, as well as current market valuations. Users can also manage rented watches, view active and past rentals, and possibly extend rental periods. Auctioned watches listed by users will include relevant details, such as starting prices and bid status, allowing users to monitor auction outcomes.

The NFT Watch Customization section will provide users with an NFT gallery to showcase their customizations, enabling viewing, sharing, and possibly selling NFTs if integrated with a marketplace. Each customization will detail design elements and blockchain metadata. Active Services will list watches under care plans, with options to renew or upgrade, and will track maintenance history. Resell guarantees will show active wear periods and guaranteed prices, allowing users to trigger resale upon completion of the guarantee period. A Time Capsule Service will schedule future deliveries for pre-purchased gifts, letting users modify delivery dates and add personalized messages. Additionally, Watch Authentication will list watches submitted for verification, with downloadable certificates for authenticated items.

For Auction Participation, users will see active bids on watches, with real-time updates on bid status and auction end times, and they can adjust or withdraw bids before closing. Auction wins will display final bid prices and payment status, with steps to finalize payments. The

Payment and Transaction History section will maintain a comprehensive record of all transactions, including purchases, rentals, care plans, and auctions, with downloadable invoices and alerts for upcoming payments. The Notifications and Alerts feature will provide service reminders for care plan expirations, auction end times, and authentication results, as well as promotions and personalized offers based on user activity or membership.

As optional enhancements, users may have access to Wishlist and Watch Comparisons, enabling them to save watches of interest and receive notifications on price drops or auction availability, with a tool to compare multiple watches based on brand, price, care plans, and customization options. The Personal

Watch Value Tracking feature could offer real-time tracking of market values for owned or rented watches, suggesting ideal resale times based on market trends. Another potential feature is Loyalty or Membership Rewards, where membership perks display benefits per tier, progress towards higher tiers, and loyalty points for discounts or exclusive services. Lastly, Support and Feedback options will provide easy access to customer support, live chat, or ticket submissions and allow users to submit feedback on services, rate past rentals or purchases, and suggest new platform features. Together, these dashboard features aim to enhance user experience.

## Appendix A – Data Dictionary

*Table 1.1 Order Table*

| Attribute        | Type       | Size | Key     | Description                                                               |
|------------------|------------|------|---------|---------------------------------------------------------------------------|
| order_id         | INT        | -    | PRIMARY | Unique identifier for each order                                          |
| customer id      | INT        | -    | FOREIGN | Links the order to a customer in the customers table                      |
| order_date       | DATETIME   | -    | -       | The date and time when the order was placed                               |
| order_status     | ENUM       | -    | -       | Tracks the current state of the order ('Pending', 'Shipped', 'Delivered') |
| total_amount     | DECIMAL    | 10,2 | -       | The total cost of the order                                               |
| shipping_address | TEXT       | -    | -       | The customer's shipping address                                           |
| billing_address  | TEXT       | -    | -       | The customer's billing address                                            |
| payment_status   | ENUM       | -    | -       | Indicates whether the order has been paid for ('Paid', 'Unpaid')          |
| payment_method   | VA RCHAR   | 50   | -       | Describes how the payment was made (e.g., Credit Card, PayPal)            |
| tracking_number  | VA RCHAR   | 100  | -       | Stores the shipping tracking number                                       |
| created_at       | TIMESTAM P | -    | -       | Automatically stores the timestamp when the record is created             |

|            |               |   |   |                                                             |
|------------|---------------|---|---|-------------------------------------------------------------|
| updated_at | TIMESTAM<br>P | - | - | Updates the timestamp<br>whenever the record is<br>modified |
|------------|---------------|---|---|-------------------------------------------------------------|

*Table 2.1 Product Category Table*

| Attribute     | Type     | Size | Key     | Description                                 |
|---------------|----------|------|---------|---------------------------------------------|
| category_id   | INT      | -    | PRIMARY | Unique identifier for each product category |
| category_name | VAR CHAR | 255  | -       | The name of the category                    |
| description   | TEXT     | -    | -       | A description of the category               |

*Table 3.1 Product Table*

| Attribute    | Type     | Size | Key     | Description                           |
|--------------|----------|------|---------|---------------------------------------|
| product_id   | INT      | -    | PRIMARY | Unique identifier for each product    |
| product_name | VAR CHAR | 255  | -       | The name of the product               |
| description  | TEXT     | -    | -       | A detailed description of the product |
| brand        | VAR CHAR | 100  | -       | The brand of the product              |
| model        | VAR CHAR | 100  | -       | The model of the product              |

|                |           |      |         |                                                                             |
|----------------|-----------|------|---------|-----------------------------------------------------------------------------|
| price          | DECIMAL   | 10,2 | -       | The original price of the product                                           |
| discount_price | DECIMAL   | 10,2 | -       | The price after any discount is applied                                     |
| stock_quantity | INT       | -    | -       | The number of units available in stock                                      |
| sku            | VARCHAR   | 100  | -       | The unique Stock Keeping Unit identifier                                    |
| status         | ENUM      | -    | -       | Indicates whether the product is currently available ('Active', 'Inactive') |
| category_id    | INT       | -    | FOREIGN | Links the product to a category in the product_categories table             |
| created_at     | TIMESTAMP | -    | -       | Automatically tracks when the product was created                           |
| updated_at     | TIMESTAMP | -    | -       | Automatically tracks when the product was last updated                      |

*Table 4.1 Inventory Table*

| Attribute    | Type | Size | Key     | Description                                 |
|--------------|------|------|---------|---------------------------------------------|
| inventory_id | INT  | -    | PRIMARY | Unique identifier for each inventory record |

|                    |            |     |          |                                                             |
|--------------------|------------|-----|----------|-------------------------------------------------------------|
| product_id         | INT        | -   | FOREI GN | Links the inventory record to a product                     |
| stock_quantity     | INT        | -   | -        | The number of units currently in stock                      |
| reorder_level      | INT        | -   | -        | The stock level at which new inventory should be ordered    |
| warehouse_location | VA RCHAR   | 255 | -        | The location of the product in the warehouse                |
| last_updated       | TIMESTA MP | -   | -        | Automatically updates when the inventory record is modified |

*Table 5.1 Promotion Table*

| <b>Attribute</b>    | <b>Type</b> | <b>Size</b> | <b>Key</b> | <b>Description</b>                              |
|---------------------|-------------|-------------|------------|-------------------------------------------------|
| promotion_id        | INT         | -           | PRIMARY    | Unique identifier for each promotion            |
| promotion_name      | VA RCHAR    | 255         | -          | Name of the promotion                           |
| discount_percentage | DECIM AL    | 5,2         | -          | The discount percentage offered                 |
| start_date          | DATE        | -           | -          | The period during which the promotion is active |
| end_date            | DATE        | -           | -          | The period during which the promotionends       |

|                |          |    |   |                                                                  |
|----------------|----------|----|---|------------------------------------------------------------------|
| promotion_code | VA RCHAR | so | - | A code customers can use to redeem the promotion                 |
| status         | ENUM     | -  | - | Whether the promotion is currently active ('Active', 'Inactive') |

*Table 6.1 Pages Table*

| Attribute         | Type       | Size | Key      | Description                                         |
|-------------------|------------|------|----------|-----------------------------------------------------|
| page_id           | INT        | -    | PRIMA RY | Unique identifier for each page                     |
| title             | VA RCHAR   | 255  | -        | Title of the page                                   |
| slug              | VARCHA R   | 255  | -        | URL-friendly version ofthetitle                     |
| content           | TEXT       | -    | -        | The main content of the page                        |
| meta_descripti on | TEXT       | -    | -        | Meta description used for SEO purposes              |
| meta_keyword s    | TEXT       | -    | -        | Meta keywords used for SEO purposes                 |
| created_at        | TIMESTA MP | -    | -        | Automatically tracks when the page was created      |
| updated_at        | TIMESTA MP | -    | -        | Automatically tracks when the page was last updated |

*Table 7.1 Users Table*

| Attribute           | Type       | Size | Key      | Description                                                 |
|---------------------|------------|------|----------|-------------------------------------------------------------|
| user_id             | INT        | -    | PRIMA RY | Unique identifier for each user                             |
| username            | VAR CHAR   | 100  | -        | The user's username                                         |
| email               | VAR CHAR   | 255  |          | The user's email address                                    |

on brand, price, care plans, and customization options. The Personal Watch Value Tracking feature could offer real-time tracking of market values for owned or rented watches, suggesting ideal resale times based on market trends. Another potential feature is Loyalty or Membership Rewards, where membership perks display benefits per tier, progress towards higher tiers, and loyalty points for discounts or exclusive services. Lastly, Support and Feedback options will provide easy access to customer support, live chat, or ticket submissions and allow users to submit feedback on services, rate past rentals or purchases, and suggest new platform features. Together, these dashboard features aim to enhance user experience.

## What Clients Say

Figure Membership Page – 3

“

"Absolutely love my new tourbillon watch from Celestial Watches. The design is elegant, and the movement is smooth. My only wish was for faster delivery, but the wait was worth it. If you're into high-end timepieces, this is the place to shop."

★★★★★

Michael Johnson

Member

“

"I am beyond impressed with the quality of the watch I purchased! The diamond-studded bezel gives it a luxurious touch, and it looks even more beautiful in person. The packaging was exquisite, and the watch arrived in pristine condition. I'll definitely be back for more."

★★★★★

Figure Signup Page – 2

The **Signup Page** enables new users to create an account with Celestial Watches. It includes form fields for entering personal information such as name, email address, password, and contact details. Users are also given the option to opt into email newsletters or marketing communications. After successful registration, users are directed to their personalized dashboard or homepage.

## 4.9 Page 7. : User Dashboard Page

The screenshot displays the 'Account' section of a user dashboard. On the left is a vertical sidebar with navigation links: 'Settings' (with a back arrow), 'Account' (highlighted in blue), 'NFT Customisation', 'Sell and Exchange', 'Rental and Lease', 'Active service management', 'Auction participation', 'Transaction History', 'Manage address', 'payment methods', 'SYSTEM', 'Notifications', and 'Preferences'. The main content area is titled 'Account' and includes the subtitle 'Real-time information and activities of your profile.' Below this is a profile picture placeholder with 'UPLOAD NEW PICTURE' and 'DELETE' links. The form contains several input fields: 'First name' (filled with 'Bryan'), 'Last name' (filled with 'Cranston'), 'Email' (filled with 'bryan.cranston@mail.com'), 'Current password' (filled with 'Current password'), and 'New password' (filled with 'New password').

**Figure** User Dashboard Page – 1

The **User Dashboard Page** is the central hub for registered users. It allows users to manage their personal information, view order history, track shipments, and edit preferences such as language, currency, and notification settings. The dashboard also displays a personalized **Wishlist** and allows users to manage payment methods for easy checkout.

## 4.10 Page 8. : Admin Dashboard Page

Figure Admin Dashboard Page – 1

The **Admin Dashboard Page** is a secure area for website administrators to manage the platform. The dashboard provides a summary of key metrics such as total sales, inventory levels, recent orders, and user activity. Admins can navigate to specific sections for order management, product listing updates, and user management. It provides tools for managing the website's operations efficiently.

**Figure** Add Product Page – 1

The **Admin Add Product Page** allows administrators to add new watches to the catalog. The page includes fields for entering product details such as **name**, **description**, **price**, **stock quantity**, **brand**, and **category**. Admins can upload product images, define tags, and set product-specific features like **water resistance** or **dial size**. Once all information is entered, the product is added to the catalog and becomes available for purchase.

## 4.13 Page 11. : Blog Page

The screenshot displays the 'Blog' page of a luxury watch retailer. The page layout includes a top navigation bar with social media icons, a search bar, and a main navigation menu. The blog content is organized into a 3x3 grid of article cards. Each card features a high-quality image of a watch, a compelling title, a short excerpt, the author's name, and the publication date. The footer section is divided into several columns, providing contact details, a newsletter sign-up, and a comprehensive list of links for various website sections.
