

## Watch ownership program

The **Personal Dashboard** for your watch-selling platform consolidates all essential features and services into a seamless interface that empowers users to manage their watch collections, customizations, and auction activities. It allows users to view and edit their profile, manage payment methods, and upgrade memberships. Users can track watches they own or rent, with details such as market valuations, care plan statuses, and auction participation, all integrated into the dashboard. Additional features include NFT watch customizations with blockchain metadata, active service management (care plans, resell guarantees, time capsule deliveries, and watch authentication), and auction participation with real-time bid updates and post-auction payment processing. A comprehensive transaction history keeps users informed of purchases, rentals, and service renewals, while notifications ensure they never miss important updates like care plan expirations or auction outcomes. Optional enhancements, such as a wishlist, watch comparison tool, market value tracking, and membership rewards, provide an enriched user experience and encourage engagement through personalized offers, service discounts, and loyalty rewards.

From a technical perspective, the dashboard can be built using **HTML, CSS, Vanilla JavaScript, PHP, MySQL, and AJAX** for dynamic updates and data management. PHP will handle backend processes, with a MySQL database storing user and service information, while AJAX can be used to ensure real-time updates for auctions and notifications without needing full-page reloads. Visual elements such as transaction history or watch value trends can be managed through custom JavaScript solutions without relying on external libraries. By integrating these technologies, the dashboard will give users complete control over their watch-related activities while promoting user retention through its interactive features and optional enhancements.
